Datapipe Auth Two-Factor Authentication – VPN Client Configuration

Any VPN client that supports RADIUS should work with Datapipe Auth. This document shows how to configure the Cisco VPN client, which is the officially supported VPN client for Datapipe Auth.

1. Configuring the VPN client

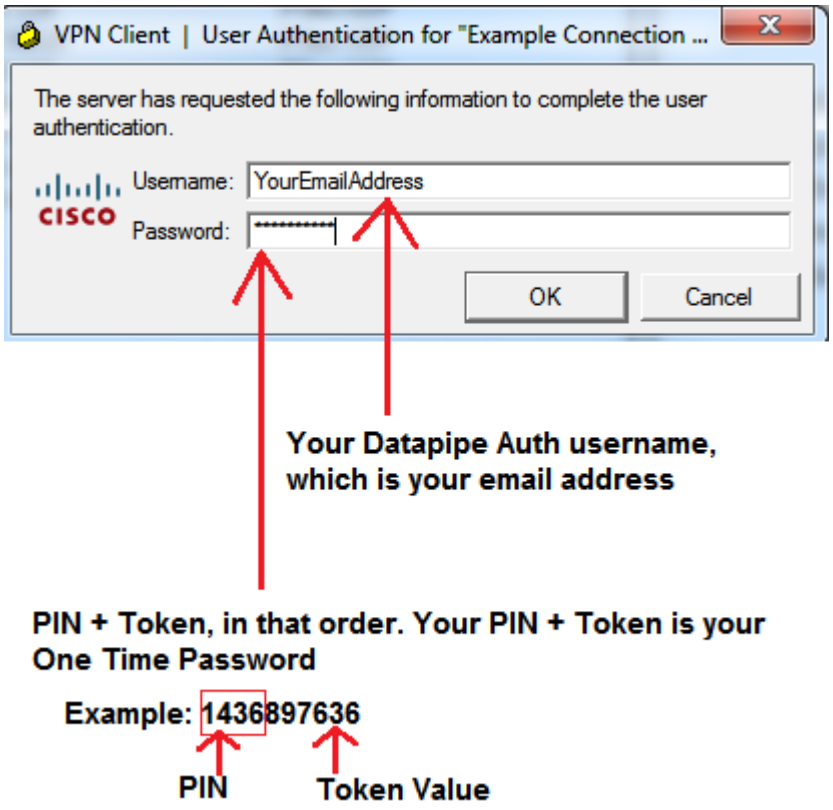

From the Connection Entries menu, choose New…

Fill in the information as the illustration shows. This information was provided to the Customer Admin in the service setup letter.

2. Using the connection to connect to your resource at Datapipe

Launch your newly configured connection and the above prompt will be presented. Enter your Datapipe Auth username and One Time Password and click OK.
